3 Free Apps Guide

CONCAT / GENOFFICE / SOLIDCRAFT
Download, connect to Claude, first prompts

Checked 29 Oct 2026 against each project's public pages. These tools are young and change fast, so confirm versions and settings on the official pages before you rely on them.

Teeno ek nazar mein

Quick compare

Tool	Replaces	Cost / licence	Works on
Concat	CapCut-style video editor	Free, open source (AGPL-3.0-or-later). "No watermarks. No account. No paywall."	Windows, macOS, Linux, Android, iOS (sideload)
GenOffice	Word, Excel, PowerPoint, PDF tools	Free, open source (Apache 2.0 core; `ee/` folder has a separate enterprise licence)	Windows 10+, macOS (Apple Silicon), Linux
SolidCraft	Parametric 3D CAD (Fusion-style)	Free, open source. Licence name not confirmed in my sources: check the repo.	Windows, macOS, Linux, FreeBSD, and in the browser

How Claude connects

Concat	Built-in MCP server, started with `concat --mcp`. Also a JSON-RPC API for scripts.
GenOffice	A `genoffice` command line tool, an agent skill and an MCP server, reported as working with Claude Code and other coding agents.
SolidCraft	MCP server: `solidcraft-cli mcp`. Tools include execute, batch, measure, screenshot, export, undo.

Honest status: Concat says it is in beta and "still has edges". SolidCraft calls itself early but usable for simple parts. GenOffice is also an early project. Treat all three as promising, not finished.

Number one

Concat

FREE CAPCUT ALTERNATIVE | LOCAL-FIRST | BETA

What you get

- **Auto captions** using local Whisper, with selectable model sizes.
- **Text to speech and voice cloning.**
- **Background removal** for people or objects, or a hand-painted mask.
- Multi-track timelines, keyframes, about 100 effects, filters and transitions.
- Export to H.264, HEVC and AV1, up to 4K 60.

Get it

- Start from the project's website (`concatenate.pages.dev`) or the GitHub Releases page.
- Windows: setup installer or .msi. macOS: Intel and Apple silicon. Linux: .deb, .rpm, .AppImage, Arch package.
- Builds are unsigned. Windows SmartScreen: choose More info, then Run anyway.

```
xattr -dr com.apple.quarantine
/Applications/Concat.app
```

macOS only, if the app will not open.

Connect to Claude

- Run the app's MCP server with `concat --mcp`.
- The exact client config is in the project's `docs/MCP.md`. Follow that file rather than a copy from anywhere else.
- Add the server to your MCP client (for Claude Code, `claude mcp add`).

Try asking: "Add auto captions to my clip and tell me what you changed."

Number two

GenOffice

WORD · EXCEL · POWERPOINT | PDF

What you get

- **Docs** edits real `.docx` files, with tracked changes, comments and equations.
- **Sheets** edits `.xlsx`, with pivot tables, slicers and conditional formatting.
- **Slides** edits `.pptx`, with masters and charts.
- **PDF** viewer and editor: annotations, forms, signatures.
- Edits to a .docx rewrite only the changed blocks, so styles and comments are more likely to survive.

Get it

- Windows 10+ (x64): .exe installer.
- macOS 11+ (Apple Silicon only): .dmg.
- Ubuntu 22.04+ (x86_64): the .deb below. Other Linux: AppImage (needs libfuse2).
- Releases live on the project's GitHub page (`genspark-ai/genoffice`) and website (`genoffice.ai`).

```
sudo apt install ./genoffice_0.5.149_amd64.deb
```

File name changes with each release.

Connect to Claude

- Coding agents can use the `genoffice` command line tool, an agent skill or the MCP server to create and edit .docx, .xlsx and .pptx files without opening the app.
- Reported as supporting Claude Code, Codex, Cursor, Gemini CLI and others.
- I could not find install commands for the agent route in my sources. Check the repo docs before you promise a setup in your reel.

Try asking: "Turn this report into a 6 slide .pptx."

The built-in AI panel works through a Genspark account, per the repo. Bring-your-own-key is reported for the agent route. Read the privacy and model settings before you put real documents in.

Number three

SolidCraft

3D CAD · FREE | RUNS IN YOUR BROWSER | EARLY

What you get

- Sketches with a constraint solver; extrude, revolve, sweep, loft, fillet, shell, holes, threads, patterns.
- Parametric timeline: change a value (like wall thickness) and dependent features rebuild.
- Assemblies with joints, sheet metal, parameters and configurations.
- Export STEP, IGES, STL, 3MF, OBJ. Import FreeCAD and Rhino files.

Get it

- **Browser:** runs as WebAssembly (about 17 MB), no install and no account. Docs at `docs.solidcraft.io/app/`.
- **Desktop:** Windows, macOS, Linux and FreeBSD builds from the GitHub repo (`tangency-labs/solidcraft`). Unsigned, so expect SmartScreen and Gatekeeper warnings.

Connect to Claude

With Claude Code:

```
claude mcp add solidcraft -- so
lidcraft-cli mcp
```

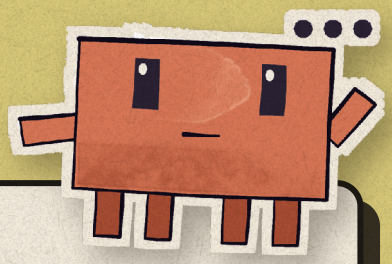

Tools exposed: `execute`, `batch`, `measure`, `screenshot`, `export`, `undo`. It can run headless or attach to the open desktop app.

Try asking: "Model a 60 × 40 × 15 mm enclosure with 2 mm walls and export a STEP."

Reality check: the project calls itself early but usable for simple parts. In one hands-on test a 2 mm fillet on a sample enclosure was refused. No CAM or PCB design, and one review says it is not ready to replace Fusion for paid work. So "engineer-grade" is a stretch today: say "simple parts" in your reel.

Bas bolo

Claude se kaam

Setup in three steps

- **1. Install** the app (or open SolidCraft in the browser).
- **2. Add its MCP server** to your MCP-capable Claude client, for example with `claude mcp add` in Claude Code.
- **3. Ask in plain words** and check the result inside the app.

Starter prompts

- **Concat:** "Cut the silences from my clip and add captions."
- **GenOffice:** "Build the spreadsheet from this CSV and add a summary chart."
- **SolidCraft:** "Design the part: a bracket, 3 mm thick, two M4 holes. Export STEP."

What Claude can actually do depends on the tools each MCP server exposes, so start with small tasks and review the output.

Before you go all in

- All three are early. Expect rough edges and keep backups of important files.
- Builds are unsigned, so your OS will warn you on first launch. Download only from the official site or GitHub releases.
- Several copies of Concat exist on GitHub. Use the one linked from its official website.
