STEP-BY-STEP GUIDE

CleanYourTV

Apne TV se ads aur tracking hatao

Android TV / Google TV | Claude Code ke saath, Wi-Fi par
No root | Kuch uninstall nahi | Restore possible

github.com/Gathin23/cleanyourtv | cleanyour.tv

Ye kya hai?

CleanYourTV ek **open-source GitHub repo** hai. Isme ek prompt (**PROMPT.md**), kuch scripts aur ek chhota launcher hai. Aapka coding assistant (jaise Claude Code) Wi-Fi par TV se judkar manufacturer ke ad aur tracking wale packages band karta hai, aur ad-bhari home screen ki jagah ek clean, Apple TV jaisa launcher laga deta hai.

Packages **delete nahi** hote, sirf disable hote hain (`pm disable-user`), isliye restore script har step undo kar sakti hai.

Shuru karne se pehle

- **TV:** Android TV ya Google TV hona chahiye. Samsung (Tizen), LG (webOS), Roku, Vizio aur Hisense VIDAA par ye nahi chalta. Fire TV par sirf kuch hissa chalta hai.
- **Computer** (laptop/PC) TV ke **same Wi-Fi** par, aur **Git** installed.
- **Coding assistant** jo commands chala sake: Claude Code, Codex ya Gemini CLI.
- **Time:** lagbhag 15 minute. Root ya cable nahi chahiye.
- **Laptop nahi hai?** README ke mutabiq community-built *Clean Your TV* phone app bhi hai (no laptop, no coding agent).

Step by step

1 Check karo ki aapka TV supported hai

Repo ke README mein **Supported TVs** list dekho (README par 380 TV models aur 101 brands listed hain). Project ke mutabiq koi bhi Android TV / Google TV chal sakta hai, par kuch models launcher accept hi nahi karte (jaise Google services ke bina wale China-market TCL).

2 Repo clone karo

Terminal kholo aur ye chalao:

```
git clone https://github.com/Gathin23/cleanyourtv
```

Pehle clone karna zaroori hai, taaki assistant repo ki apni scripts (backup aur Home guard inhi mein hain) reuse kare, apni scripts na likhe.

3 Folder apne assistant mein kholo

Clone hue folder **`cleanyourtv`** ko Claude Code (ya Codex / Gemini CLI) mein kholo. Example:

```
cd cleanyourtv
claude
```

4 TV par debugging on karo

- Settings > Device Preferences > About kholo.
- **Build** par OK baar-baar dabao (article ke mutabiq 7 baar) jab tak developer mode on na ho.
- Wapas jao: Settings > Developer options > **USB debugging ON**.
- TV **on** rakho aur laptop ke same Wi-Fi par rakho.

Menu ke naam brand ke hisaab se alag ho sakte hain.

5 PROMPT.md paste karo

Repo ke root mein **`PROMPT.md`** hai. Uska poora text assistant mein paste karo aur **apne TV ka model** bhar do. Bas, baaki kaam assistant karega.

6 Assistant ko kaam karne do, par approve karte raho

Prompt ke mutabiq assistant ye karta hai:

- Wi-Fi par TV dhundhkar ADB se connect hota hai (TV par ek baar **Allow** karna padega).
- Kuch badalne se pehle package list aur settings ka **backup** leta hai aur restore script banata hai.
- Poochta hai ki aap kaun se **streaming apps, voice assistant, Chromecast aur update service** use karte ho. Sahi jawab do, bina jawab ke wo inko haath nahi lagata.
- Packages chhote batches mein disable karta hai aur har batch ke beech TV ka **screenshot** leta hai.
- Launcher tabhi build aur install karta hai jab check ho jaye ki TV APK accept karta hai.

Tip: Claude Code ko approval-prompts ke saath chalao. Jo bhi TV par kuch likhe ya disable kare (**`pm disable-user`**), usko approve karke hi aage badho.

7 Result check karo

- Home screen par naya clean launcher dikhna chahiye.
- Apne saare apps (Netflix, YouTube, etc.) khol ke dekho.
- TV ko **reboot** karo aur dekho ki seedha Home screen par aata hai.

Kuch galat lage to turant neeche wala Restore step chalao.

8 **Kaam ke baad debugging band karo**

- TV par **USB debugging OFF** karo aur saari authorizations revoke karo.
- TV reboot karo. Port 5555 par connection refuse hona chahiye.

Wajah: network ADB plaintext hota hai. Kuch firmware (`ro.adb.secure=0`) par same LAN ka koi bhi device shell le sakta hai.

Wapas purana kaise karein (Restore)

README ka one-liner. **192.168.1.50** ki jagah apne TV ka IP daalo, aur **<your tv>** ki jagah **`examples/`** mein apne model ka folder.

```
TV_HOST=192.168.1.50 \
  tools/restore.sh \
  examples/<your tv>/debloat.txt
```

(Ye ek hi command hai. Line break sirf padhne ke liye hain.)

- Google TV par us command ke end mein **stock launcher ka package name** bhi do (third argument).
- Agar TV itna boot hi nahi hota ki restore chal sake, to recovery menu se **factory reset** aakhri raasta hai. Isse apps aur accounts wipe ho jaate hain.

Safe-run checklist

- Pehle repo clone karo, phir prompt paste karo (backup aur Home guard scripts use hon).
- Assistant ko approval-mode mein chalao, bypass mode mein nahi.
- Chhote batches aur beech mein screenshots, taaki pata chale kaun sa package problem kar raha hai.
- Core packages (permission controller, package installer, systemui, settings, android) kabhi disable mat hone do.
- Shuru karne se pehle restore ka tareeka jaan lo.

Dhyan rakho

- Kuch users ne TV brick hone ki report ki hai (ek Mi TV Stick ka case GitHub issue 884 mein bataya gaya). Ye tool at-your-own-risk hai.
- Software update ke baad ads wapas aa sakte hain, kyunki is tool ka koi bhi badlav permanent nahi hota.
- Ye ek independent open-source project hai, kisi TV maker ya platform se affiliated nahi.
- Prompt khud ek baar padh lo aur batches approve karne se pehle dekho ki kya disable ho raha hai.

Official links

- Repo: **`github.com/Gathin23/cleanyourtv`**
- Website: **`cleanyour.tv`**
- **cleanyourtv.com** official nahi hai. README ke mutabiq us naam ke baaki domains is project ke nahi hain.

Ye guide project ke README, PROMPT.md ke summary (DevelopersDigest, 25 Oct 2026) aur PPC Land ki report par based hai. Ye steps documentation se liye gaye hain, kisi TV par test nahi kiye gaye. Repo roz update ho raha hai, isliye chalane se pehle latest README ek baar milaa lo.
