// GUIDE · @techie.addy

AI ki censorship hatane ka

HERETIC

STEP-BY-STEP GUIDE

FREE · OPEN-SOURCE · 1 COMMAND

Apne PC pe chalne wale open AI models se safety refusals hatane ka free GitHub tool. Bina training, bina coding.

// TOOL	// BY
Heretic (heretic-llm)	**Philipp Emanuel Weidmann**
// LICENSE	// GITHUB
AGPL-3.0	**github.com/p-e-w/heretic**

// NOTE

Ye guide Heretic 2.x ke README (Nov 2026) ke hisaab se hai. Commands badal sakte hain, isliye GitHub README bhi ek baar check kar lena.

@techie.addy

// 01 — PEHLE YE SAMJHO

HERETIC KYA KARTA HAI?

- **Refusals hatata hai.** Open models ki "safety alignment" (jis wajah se wo "Sorry, I can't help with that" bolte hain) ko suppress karta hai.
- **Training nahi.** Mehengi post-training ki jagah directional ablation ("abliteration") use karta hai, aur ek optimizer apne aap best settings dhoondhta hai, taaki model ki quality kam se kam kharab ho.
- **Sirf open models.** Ye tumhare PC pe chalne wale models ko badalta hai. ChatGPT, Gemini jaise hosted AI ko nahi badal sakta.

// 02 — KYA CHAHIYE

REQUIREMENTS CHECKLIST

Python	3.10 ya usse naya
PyTorch	2.6+, tumhare hardware ke hisaab se install hua
GPU	Recommended. README ke mutabik RTX 3090 pe Qwen3-4B-Instruct-2507 mein lagbhag 30-40 minute lagte hain
Internet + disk	Model Hugging Face se download hota hai, isliye model ke size ki jagah chahiye
Low VRAM?	4-bit quantization option (`bnb_4bit`) VRAM kam karta hai, thodi accuracy ke badle

@techie.addy

STEP 1 SE 4: TAIYAARI

1 PYTHON VERSION CHECK KARO

Terminal (Windows: Command Prompt/PowerShell) kholo aur likho:

```
$ python --version
```

Result 3.10 ya usse upar hona chahiye.

2 VIRTUAL ENVIRONMENT BANAO (recommended)

```
# sab OS
python -m venv heretic-env
# Windows
heretic-env\Scripts\activate
# Mac / Linux
source heretic-env/bin/activate
```

3 PYTORCH INSTALL KARO

pytorch.org/get-started/locally kholo, apna OS, pip aur GPU (CUDA) chuno, aur wahan jo command mile wahi chalao. Phir check karo:

```
$ python -c "import torch; print(torch.cuda.is_available())"
```

NVIDIA GPU ke saath **True** aana chahiye.

4 HERETIC INSTALL KARO

```
$ pip install -U heretic-llm
```

@techie.addy

// 04 — RUN

STEP 5 SE 7: CHALAO

5 MODEL KE SAATH HERETIC RUN KARO

```
$ heretic Qwen/Qwen3-4B-Instruct-2507
```

`Qwen/Qwen3-4B-Instruct-2507` README ka example model hai. Isko Hugging Face ke kisi bhi model ke naam se badal sakte ho. Shuru karne se pehle model ka license padh lena.

6 INTEZAAR KARO

Heretic start mein tumhare system ka benchmark karke batch size chunta hai, phir apne aap process chalata hai. Koi manual setting nahi chahiye. RTX 3090 pe is example model mein lagbhag 30-40 minute lagte hain (README ke mutabik).

7 RUN KE BAAD CHOOSE KARO

Heretic ye options deta hai, akele ya saath mein:

- Model ko **locally save** karo
- **Hugging Face** pe upload karo
- Model ke saath **chat** karke check karo
- Standard **benchmarks** chalao

// EXTRA

- Default mein Heretic **censorship removal** karta hai. Slop kam karna, sycophancy kam karna jaise doosre behaviors ke liye repo mein alag config files hain (`config.noslop.toml`, `config.nosyco.toml` vagairah).
- Saare options ka reference: `config.default.toml`
- Kisi uploaded model ko reproduce karna ho: `heretic --reproduce path/to/reproduce.json`

@techie.addy

// 05 — AGAR ATKE

TROUBLESHOOTING & NOTES

"pip" command nahi mil raha	Aise chalao: `python -m pip install -U heretic-llm`
GPU detect nahi ho raha	Step 3 ka check dobara chalao. `False` aaye to PyTorch ka sahi (CUDA) build install karo.
Out of memory	Chhota model chuno ya `quantization` option ko `bnb_4bit` karo.
Purane Heretic 1.x config	2.x mein kaam nahi karte. Repo ka `docs/migration_v1_to_v2.md` dekho.

ZIMMEDARI SE USE KARO

- Safety guardrails hatne ke baad model aisa content bhi bana sakta hai jo normally mana kar deta. Ise apni zimmedari pe, apne laws aur model ke license ke andar hi use karo.
- Heretic sirf tumhare local open models ko badalta hai. ChatGPT jaisa hosted AI nahi.
- Heretic AGPL-3.0 license pe hai aur bina warranty ke aata hai.
